                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention relates to human single exon nucleic acid probes
                                                                                                                                       61 LMPAVQNWLVEVPTVSPNSRFTYHMVSGMSLRPRVNYLQDFSYQRSLKFRPKGKTCPKEI 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel single exon nucleic acid probes (see AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
           Peptide #474 encoded by probe for measuring human breast gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              breast disease and non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single exon nucleic acid probe used to measuring gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The recombinant enzyme was produced by cloning the gene encoding it from a C. thermohydrosulphuricum genomic library and using it to express the enzyme in a host cell e.g. E.coli which is easier to cultivate and has less complex nutritional requirements than C. thermohydrosulphuricum (which is an obligate anaerobic thermophilic organism). The enzyme is used to hydrolyse starch, amylase or pullulan, opt. in conjunction with a glucogenic or maltogenic enzyme. It has an optimum temp. range of 80-85 deg.C, i.e. 5 deg. lower than that of the native enzyme, but the heat stability is the same. At least 10 differently sized polypeptides having the same enzymic activities were produced, of Mr 100 000 - 165 000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63 PAVQN------WL-VEVPTVSP---NSRFTYHMVSGM-----SLRPRVNYLQDFS 102

The sequences given in AAR29646-51 are encoded by a DNA fragment derived from the Entomopoxvirus Amsacta moore! (AmEPV) around the spheroidin DNA sequence. The open reading frames encode the spheroidin protein itself and also other structural or requilatory genes associated with spheroidin. EPV spheroidin has no significant amino acid homology to any previously reported protein. It is a non-essential protein which exogenous DNA. The spheroidin gene is naturally expressed at high levels. Small fragments of the surrounding DNA can be used as regulatory sequences if placed in operative association with foreign

The method comprises administering to the subject an immunomodulatory composition comprising a pharmaceutical carrier and at least one MMTV antigen (or a discontinuous specific cellular or humoral response. The compositions and methods of the invention are useful for treating or preventing a human disease or disorder caused by MMTV, or a biological or chemical agent that reacts with an antiboddy directed towards an MMTV antigen. The immunomodulatory exposed to MMTV or MMTV antigen. The immunomodulatory exposed to MMTV or MMTV antigen ractive agents. The immunomodulatory compositions can be used in a preventative manner for those subjects not have use in a diagnostic assays. The present sequence represents the

AAY30165-70 represent proteins encoded by open reading frames (ORFs) of the Amsacta moorei entomopoxvirus spheroidin gene and flanking sequences. The DNA is used to make expression systems of the invention. The specification describes an Entomopoxvirus (EPV) expression system that is capable of directing the replication and expression system cherologous gene in a selected host cell. The expression of a heterologous gene sequence operably linked to the selected heterologous gene sequence or the production of selected heterologous sequences and the production of selected betaroins in insect and mammalian host cells e.g. human, rodent and primate cells. EPV thymidine kinase and spheroidin genes can also be used in vertebrate poxviruses such as vaccinia and swinepox virus. The expression vectors can also be used for the control of insect pests through the insertion of a gene encoding an insect toxin into the expression vector which will infect the target pest and produce large quantities of the toxin. Spheroidin and thymidine kinase are nonessential proteins which makes them ideal for the insertion of
                                                                      5

retrovirus-related pol polyprotein - mouse intracisternal A-particle MIA14

CiSpecies: mouse intracisternal A-particle MIA14

A; Note: host Mus musculus (house mouse)

C; Date: 31-Mar-1989 #sequence_revision 31-Mar-1989 #text_change 30-Jun-1993

C; Date: 31-Mar-1989 #sequence_revision 31-Mar-1989 #text_change 30-Jun-1993

C; Accession: B26787

A; Htels: Nucleotide sequence of a complete mouse intracisternal A-particle genome: relat
A; Reference number: A93027; MUD:87311859

A; Accession: B26787

A; Accession: B26787

A; Accession: B26787

A; Mote: the authors translated the codon TGG for residue 64 as Asp, AAC for residue 92 a
C; Comment: The DNA sequence was obtained from GenBank, release 55.0.
C; Comment: This particle is a defective retrovirus.
C; Genetics:
A; Genetics:
C; Seperfamily: pol polyprotein
C; Superfamily: pol polyprotein
C; Keywords: polyprotein; reverse transcriptase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      retrovirus-related pol polyprotein - mouse intracisternal A-particle MIAIL3

Sequence 22, Application US/07743357
Patent No. 5858646
GENERAL INFORMATION:
APPLICANT: Kang, Yong C.
TITLE OF INVENTION: Polypeptide having immunological
TITLE OF INVENTION: activity for use as diagnostic reagent and/or vaccine
NUMBERONE OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
ADDRESSEE: KIRBY EADES GALE BAKER
  TITLE OF INVENTION: HIV POSTITIVE BASED ON THE PHENOTYPIC DRUG SENSITIVITY FITLE OF INVENTION: OF HUMAN HIV STRAINS FILE REFERENCE: 1377-125 CURRENT APPLICATION NUMBER: US/09/117,217 CURRENT FILING DATE: 1998-07-24 NUMBER OF SEQ ID NOS: 15 SOFTWARE: Patentin Ver. 2.0 SEQ ID NO 14 LENGTH: 562
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     60 FSDCYIIHYFDDILCAAET----KDKLIDCYTFLPAEVANAGLAIASDKIQTSTPFHYL 114

COUNTRY: Canada
ZIP: KIM 1H8
COMPUTER REABALE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/07/743,357
FILING DATE: 21-AUG-1991
CLASSIFICATION: 424
PRIOR APPLICATION DATA:
APPLICATION NUMBER: PCT/CA90/00062
FILING DATE: 23-FEB-1990
ATTORNEY/AGENT INFORMATION:

Patent No. 585846
ENERAL INFORMATION:
APPLICANT: Kang, Yong C.
TITLE OF INVENTION: Pollypeptide having immunological
TITLE OF INVENTION: activity for use as diagnostic reagent and/or vaccine
NUMBER OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
ADDRESSEE: KIRBY EABES GALE BAKER
STREET: Box 3432, Station D
                                                                                                                                                                                                                                                                                5

Sequence 4, Application US/07743357
Patent No. 5858646
GENERAL INFORMATION:
TITLE OF INVENTION: Polypeptide having immunological
TITLE OF INVENTION: activity for use as diagnostic reagent and/or vaccine
NUMBER OF SEQUENCES: 22
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                2

                                                                                                    The sequence is that to an insurint vegetable in the second human endogenous retrovirus (IDDMK1.2-2) probe.

The retrovirus has Superantigen (SAg) activity. It can be used as part of a method is specifically used to diagnose type I diabetes mellitus. Modified proteins expressed by the retroviral sequence (without SAg activity but still able to induce an immune response) are useful in vaccines to treat or prevent SAg-related autoimmune similarly to treat such diseases. Retroviral-encoded SAg are important in pathogenesis of autoimmune disease, probably by activating autoreactive T cells. The method is very specific (it can differentiate between expressed and non-expressed viral nucleic acids) and can be used even where the pathogen is an ubiquitous endogenous retrovirus. Blood corporate the pathogen is an ubiquitous endogenous retrovirus. Blood diagnosis can be made before clinical signs are apparent, allowing carly intervention before severe tissue damage has occurred.

This is the polymerase protein (Pol) of a new human endogenous retrovirus (HERV), designated IDDMK1.2-22, that has been identified as the source of superantigen (SAG) activity in insulin-dependent diabetes mellitus (IDDM) patients. The endogenous retrovirus is ubiquitous in the human genome but is only expressed in diabetic individuals. The HERV encodes SAG activity within the env gene. A claimed process for the diagnosis, including the pre-symptomatic diagnosis, of a human autoimmune disease associated with a HERV paving SAG activity (especially including the pre-symptomatic having SAG activity (especially including the pre-symptomatic sepeat, env or pol); (b) a protein or peptide expressed by the HERV capable either (a) the mRNN of an expressed by the HERV capable of blocking transforming specifically associated with the HERV. Products of the invention can be used to identify substances capable of blocking transcription or translation of SAG-encoding nucleic acid sequences, useful in therapy and/or prevention of autoimmune disease associated with the SAG. A nucleic acid encoding the endogenous SAG in IDDM suggests a general model according to which self SAG-driven and systemic activation of autoreactive T cells leads to organ-specific autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SDCYIIHYFDDILCAAETKDKLIDCYTFLPAEVANAGLAIASDKIQTSTPFHYLGMQIEN 120

The present invention relates to human single exon nucleic acid probes (SENP: see AA110068-AA12459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLea cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical espithelial cells. By measuring gene expression, the probes are therefore cervical in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #4670 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 FTIPLAEQDCEKFAFTIPAINNKEPATRFQWKVLPQGMLNSPTICQTFVGRALQPVRDKF

                                                                                                                                                                                                                                                                                                  JSRV causes epithelial carcinoma in ovine animals, partic. pulmonary adenomatosa in sheep. The complete cDNA sequence of the JSRV genome was prepared from an approx. 8.7kb band of poly-A RNA isolated from semi-purified lung-lavage samples from infected sheep. The invention includes the Pol amino acid sequence or any part of it which is capable of specific immunological reaction with antibodies directed against JSRV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Probe; human; microarray; gene expression; cervical epithelial cell;

The invention provides a method for inducing an immune response to mouse mammary tumor virus (MMTV) in a human subject. The method comprises administering to the subject an immunomodulatory composition comprising a pharmaceutical carrier and at least one MMTV antigen (or a discontinuous
                                                                                                                                                                       predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                            (see AA100110-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to anucleic acid expressed in the human breast. The probes are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel immunomodulatory compositions of mouse mammary tumor virus (MMTV)
                                                                               present invention relates to novel single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 FTIPLAEQDCEKFAFTIPAINNKEPATRFQWKVLPQGMLNSPTICQTFVGRALQPVRDKF 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immune response; mouse mammary tumor virus; MMTV; immunomodulatory; epitope; passive immunotherapy; gag; pol; pro.

                                                                                                                                                                                                                                                                                          see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

epitope of MMTV) in an amount sufficient to elicit an increase in a MMTV specific cellular or humoral response. The compositions and methods of the invention are useful for treating or preventing a human disease or disorder caused by MMTV, or chemical agent that reacts with an antibody directed towards an MMTV antigen. The compositions and antibodies may be used in passive immunotherapy. The immunomodulatory compositions can be used in a preventative manner for those subjects not exposed to MMTV or MMTV antigen reactive agents. The MMTV antigens also have use in diagnostic assays. The present sequence represents the amino acid sequence of the MMTV gag-pol-pro polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human retrovirus-5, its nucleic acid and derived proteins, useful for the treatment, diagnosis and prevention of autoimmune and inflammatory diseases -

This is the human retrovirus-5 HRV-5 pol amino acid sequence. The full length HRV-5 nucleotide sequence AA23523, encodes the gag, pol and progenes of the nucleoprotein of the virus. The pol gane encodes the components of the nucleoprotein of the virus. The pol gane codes for proteins involved in nucleic acid synthesis and recombination, and the progene gives rise to the protease protein. The HRV-5 nucleotide sequences are used in the invention to create PCR primers which can be used to detect HRV-5 in flamed joints, but not in normal synovium. HRV-5 nucleic acids may also be used to screen for specific inhibitors (potential therapeutic agents) and to produce recombinant polypeptides. The virus itself, when disabled, can be used as a gene therapy vector. HRV-5 polypeptides are used to raise antibodies (which may used to detect the virus or as therapeutic inhibitor), to screen for modulators and in vaccines. Fragments of the HRV-5 nucleotide may be used as probes or primers for viral detection (for diagnosis or prognosis) and as sources of the reapeutic antisense sequences. The various therapeutic agents can be resed to treat rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, inflammatory bowel disease, Sjogren's syndrome and other inflammatory or autoimmune conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                             84 DCYTFLPAEVANAGLAIASDKIQTSTPFHYLGMQIENRKIKPQKIEIRKDTLKTLNDFQK 143
                                                                                                                                                                                                                                                                                    IBF and IBF cDNA are useful in studies on the immune system. Treatment for IgE-mediated diseases may be possible. IBF may enhance B-cell differentiation into an immunoglobulin-secreting cell.
                                                                                                                                                                                                                                                  Gaps

This invention relates to isolated polynucleotide sequences encoding a polypeptide with RNA dependent DNA polymerase (reverse transcriptase RT) activity. RTs are found in a variety of retroviruses and their defining activity is the ability to synthesise a CDNA strand using an RNA template. The invention includes sequences AAA87808-A87822 and the AAA87842 which represent nucleotide sequences encoding RT polypeptides. Included in the invention are reverse transcriptase protein sequences AAB12989-B12995. Sequences AAA87829-A87839 and AAA87843-A87897 represent oligonucleotides used in the identification and Synthesis of the RT nucleotide sequences of the invention. Which exhibit improved stability and/or improved modified RT proteins, which exhibit improved stability and/or improved polymerase chain reaction (PCR) methods. The nucleotide sequences can be used in sequence are used in improved polymerase chain reaction (PCR) methods. The nucleotide sequence can be used in sequencing methods.

RTS are found in a variety of retroviruses and their defining activity is the ability to synthesise a cDNA strand using an RNA template. The invention includes sequences AAA87808 A87822 and AAA8780.487842 which represent nucleotide sequences encoding RT polypeptides. Included in the invention are reverse transcriptase protein sequences AAB12989-B12955. Sequences AAA87829-A87839 and AAA87843-A87897 represent oligonucleotides used in the identification and synthesis of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences encode modified RT proteins, which exhibit improved stability and/or improved solubility, relative to naturally occurring reverse transcriptases. The modified RT nucleotide and protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a reverse transcriptase protein of the invention.

RTs are found in a variety of retroviruses and their defining activity is the ability to synthesise a cDNA strand using an RNA template. The invention includes sequences AAA87808 A87822 and AAA87840.A67842 which represent nucleotide sequences encoding RT polypeptides. Included in the invention are reverse transcriptase protein sequences AAB12989-B12955. Sequences AAA87803 and AAA87843.A87897 represent oligonucleotides used in the identification and synthesis of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences of the invention. Many of the stability and/or improved solubility. relative to naturally occuring reverse transcriptases. The modified RT nucleotide and protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a reverse transcriptase protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reverse transcriptase; RT; polymerase chain reaction; PCR; retrovirus;

RTs are found in a variety of retroviruses and their defining activity is the ability to synthesise a cDNA strand using an RNA template. The invention includes sequences AA87808-A87822 and AAA87840-A87842 which represent nucleotide sequences encoding RT polypeptides. Included in the invention are reverse transcriptase protein sequences AAB12985-B12955. Sequences AAA87829-A87839 and AAA87843-A87897 represent oligonucleotides used in the identification and synthesis of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences of the invention. Many of the RT nucleotide sequences not altitude and protein sequence reverse transcriptases. The modified RT nucleotide and protein sequence
                                                                                                                                                                                                                                                                                                                                                                   MAV reverse transcriptase RT protein modified for eukaryotic expression.

Using the plasmid pT8RAV the RT could be recombinantly produced in transformed host cells. The RT obtd. could then be used as a reagent for the synthesis of cDNA from mRNA in genetic engineering.
